4 次の英文を読んで，あとの問いに答えよ。（配点　22）

In 2001, a terrible famine hit the small African country of Malawi. The rains had come too late, and then too heavily, and the corn harvest failed. In a village called Masitala, a fourteen-year-old boy named William Kamkwamba watched his family eat only one small meal a day. Like most families in the village, they were farmers, and without a harvest, they had no money. Soon his family could no longer pay his school fees, and William (　ア　).

William loved science, and he did not want to stop learning. So he began to visit a small library that had been set up in a nearby primary school. His English was poor, but he studied the pictures and diagrams in the books carefully. One day he found a book called *Using Energy*. On its cover was a picture of a row of windmills. The book explained that a windmill could produce electricity. William thought, “If I can build a windmill, my family can have electric lights. Maybe it can even pump water for our fields.”

Only about two percent of people in Malawi had electricity at that time. At night, William's family used *kerosene lamps, which were expensive and filled the house with smoke. They went to bed early because there was nothing else to do in the dark.

William had no money to buy parts, so he went to a *scrapyard near his school. Every day he searched through piles of metal for anything he could use. He collected an old bicycle frame, a broken tractor fan, plastic pipes, and the small *dynamo from a bicycle light. When people in the village saw him carrying home bags of rubbish, (　イ　). Some called him *misala* — crazy. Even his mother worried about him.

William did not give up. He cut the plastic pipes in half and heated them over a fire to shape them into blades. He used a tall *blue gum tree to make a tower. After weeks of work, his first windmill stood five meters high behind his house. A crowd gathered as he connected a light bulb to the dynamo. The wind began to blow, the blades turned, and the bulb flickered and then lit up. The people who had laughed at him began to cheer.

That windmill gave his family light at night and allowed William to charge his neighbors' mobile phones. Later, he built a larger windmill that pumped water from a well. For the first time, his family could water their crops during the dry season, and the village no longer had to depend completely on the rain.

News of the “boy who harnessed the wind” spread. In 2007, William was invited to speak at an international conference in Tanzania. Standing in front of scientists and engineers from around the world, he was so nervous that he could say only a few sentences: “I try, and I made it.” Those simple words moved the audience. With their support, he went back to school, and he later graduated from a university in the United States.

Today, William shares his story with young people around the world. He often tells them that what made the windmill possible was not money or expensive tools. His story shows that (　ウ　).

【必答問題】

5 次の英文を読んで，あとの問いに答えよ。（配点　24）

Look up at the night sky. How many stars can you see? If you live in a city, the answer is probably “very few.” This is not because there are fewer stars than in the past. It is because of light pollution — too much artificial light at night.

Light pollution happens when outdoor lights are too bright, shine in the wrong direction, or are left on when no one needs them. Light from streetlights, advertising signs, and buildings goes up into the sky and makes it glow. A study published in 2016 found that about 80 percent of the world's population lives under skies affected by light pollution. The Milky Way can no longer be seen from the homes of around one third of humanity. The situation is especially serious in developed countries. In North America, about 80 percent of people cannot see the Milky Way, and the figure for Japan is about 70 percent. In Europe, it is about 60 percent (See (イ)Figure 1).

Light pollution is not just a problem for people who love stars. It also affects wildlife. Many animals depend on the natural cycle of day and night. Sea turtles, for example, lay their eggs on beaches. When the babies come out of their eggs at night, they move toward the brightest *horizon, which is usually the moon shining over the sea. (　ア　), on beaches near bright cities, many baby turtles crawl toward the lights on land and never reach the ocean. Birds that fly at night are also confused by bright buildings, and every year millions of them die after hitting windows.

Humans are affected, too. Our bodies produce a *hormone called melatonin when it is dark, and this hormone helps us sleep. Bright light at night, especially blue light from LED lights and smartphone screens, can reduce the amount of melatonin our bodies make. Some scientists believe that this may lead to poor sleep and other health problems.

The good news is that light pollution is easier to solve than many other kinds of pollution. When we turn off a light, the pollution disappears immediately. Some cities have started to use streetlights with covers that point the light down toward the ground, so that less light escapes into the sky. Others have changed to warmer-colored lights that give off less blue light. Some towns also use lights with *motion sensors, which turn on only when people walk or drive by.

There are now more than 200 “*Dark Sky Places” around the world, which have been recognized for protecting their night skies. In 2018, Iriomote-Ishigaki National Park in Okinawa became the first Dark Sky Place in Japan. Visitors there can enjoy a sky full of stars, and the park has become popular with tourists. Protecting the darkness, it seems, can also bring economic benefits.

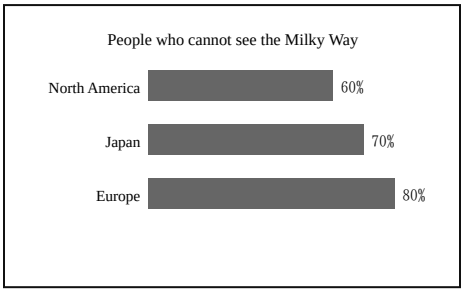

注） *horizon ＝地平線，水平線　*hormone ＝ホルモン　*motion sensor ＝人感センサー
*Dark Sky Place ＝星空保護区
